DEPARTMENT OF TRANSPORTATION**

***Connected Vehicle Dynamic Mobility Applications for  
Intelligent Network Flow Optimization (INFLO)***

**2012 National Rural ITS Conference  
Session C1: Status and Applications of Connected Vehicle Technology  
September 18, 2012**

**Presenter:**

***Kate Hartman, USDOT  
ITS Joint Program Office***

# Presentation Overview

---

- Connected Vehicle Background
- Overview of Dynamic Mobility Applications
- Intelligent Network Flow Optimization (INFLO)
- INFLO DMA Status

# Connected Vehicle Overview

## Research Initiative lead by ITS Joint Program Office

- About wireless communications between vehicles and other vehicles (V2V) as well as between vehicles and the surrounding infrastructure (V2I) such as traffic signals, work zones, etc.
- Research to Improve;
  - ❖ *Safety*
  - ❖ *Mobility*
  - ❖ *Environment*

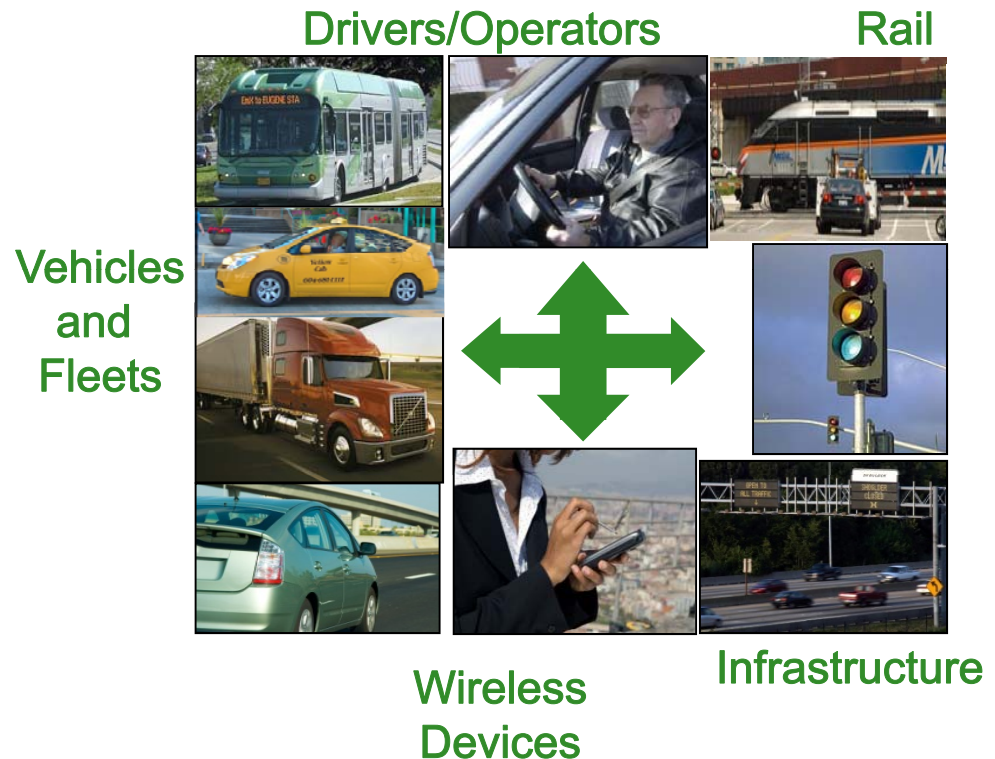

# ITS Research: Multimodal and Connected

Research of technologies and applications that use wireless communications to provide connectivity:

- Among vehicles of all types
- Between vehicles and roadway infrastructure
- Among vehicles, infrastructure and wireless consumer devices

FCC Allocated 5.9 GHz Spectrum (DSRC) for Transportation Safety

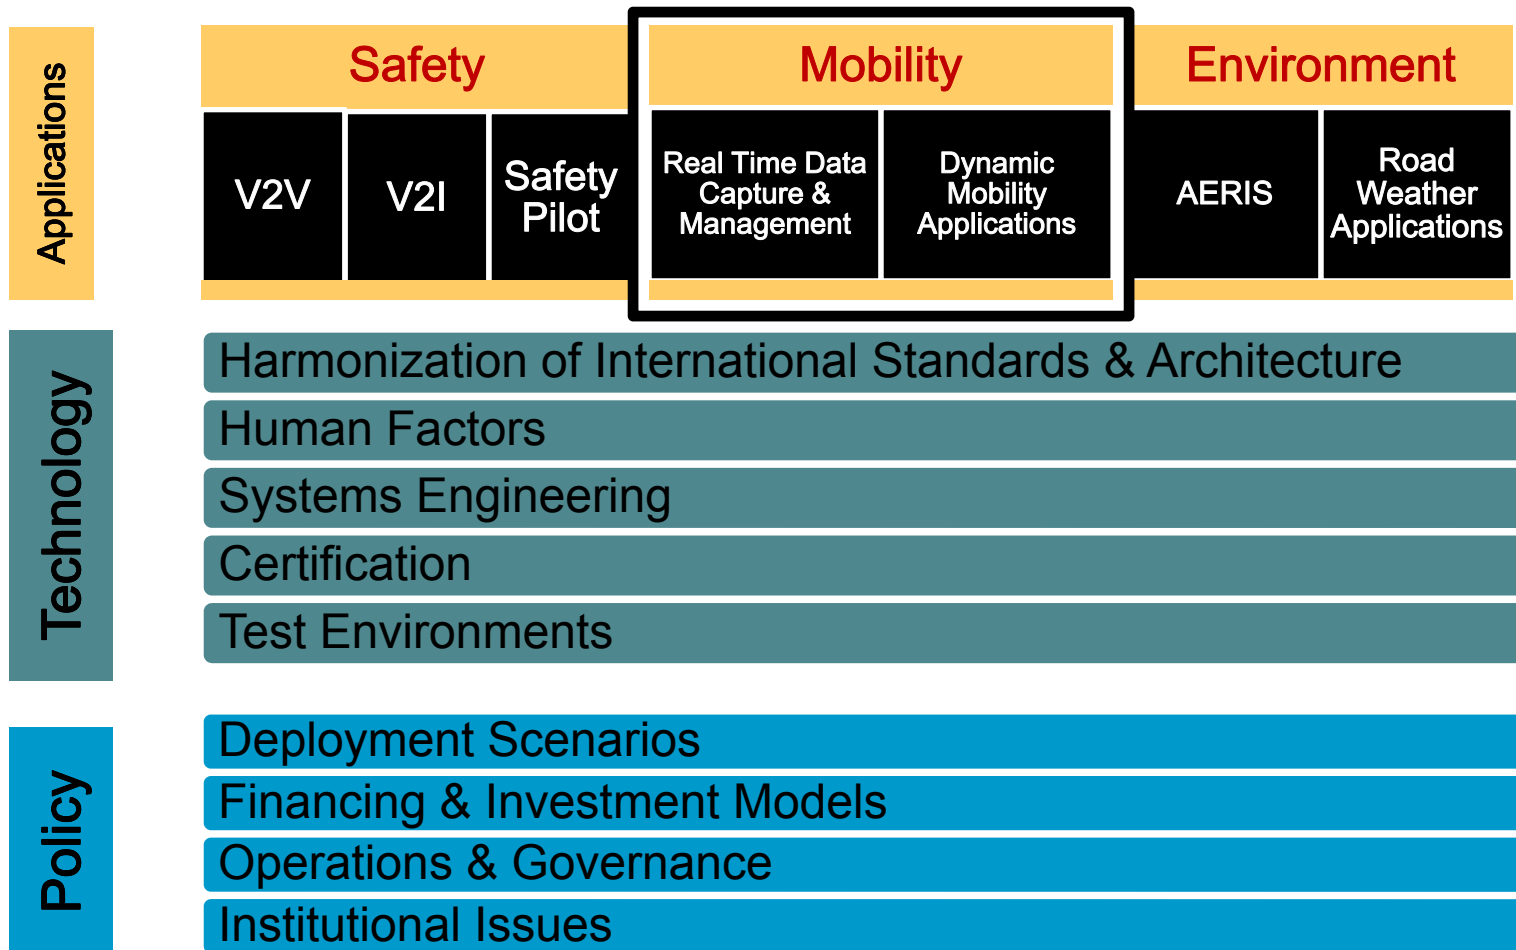

# Fully Connected Vehicle

*Up to 80% of non-impaired crash types may be impacted by connected vehicle technology*

Source: NHTSA

# Connected Vehicle Structure

# DMA Program

---

- The *Dynamic Mobility Applications (DMA) Program* seeks to create applications that **fully leverage frequently collected and rapidly disseminated multi-source data** gathered from connected travelers, vehicles and infrastructure, and that increase efficiency and improve individual mobility while reducing negative environmental impacts and safety risks.

# USDOT Dynamic Mobility Applications (DMA) Program

---

## Vision

- Expedite development, testing, commercialization, and deployment of innovative mobility application
  - maximize system productivity
  - enhance mobility of individuals within the system

## Transformative Mobility Applications

*(May have more impact when BUNDLED together)*

## Objectives

- Create applications using frequently collected and rapidly disseminated multi-source data from connected travelers, vehicles (automobiles, transit, freight) and infrastructure
- Develop and assess applications showing potential to improve nature, accuracy, precision and/or speed of dynamic decision
- Demonstrate promising applications predicted to significantly improve capability of transportation system
- Determine required infrastructure for transformative applications implementation, along with associated costs and benefits

## Project Partners

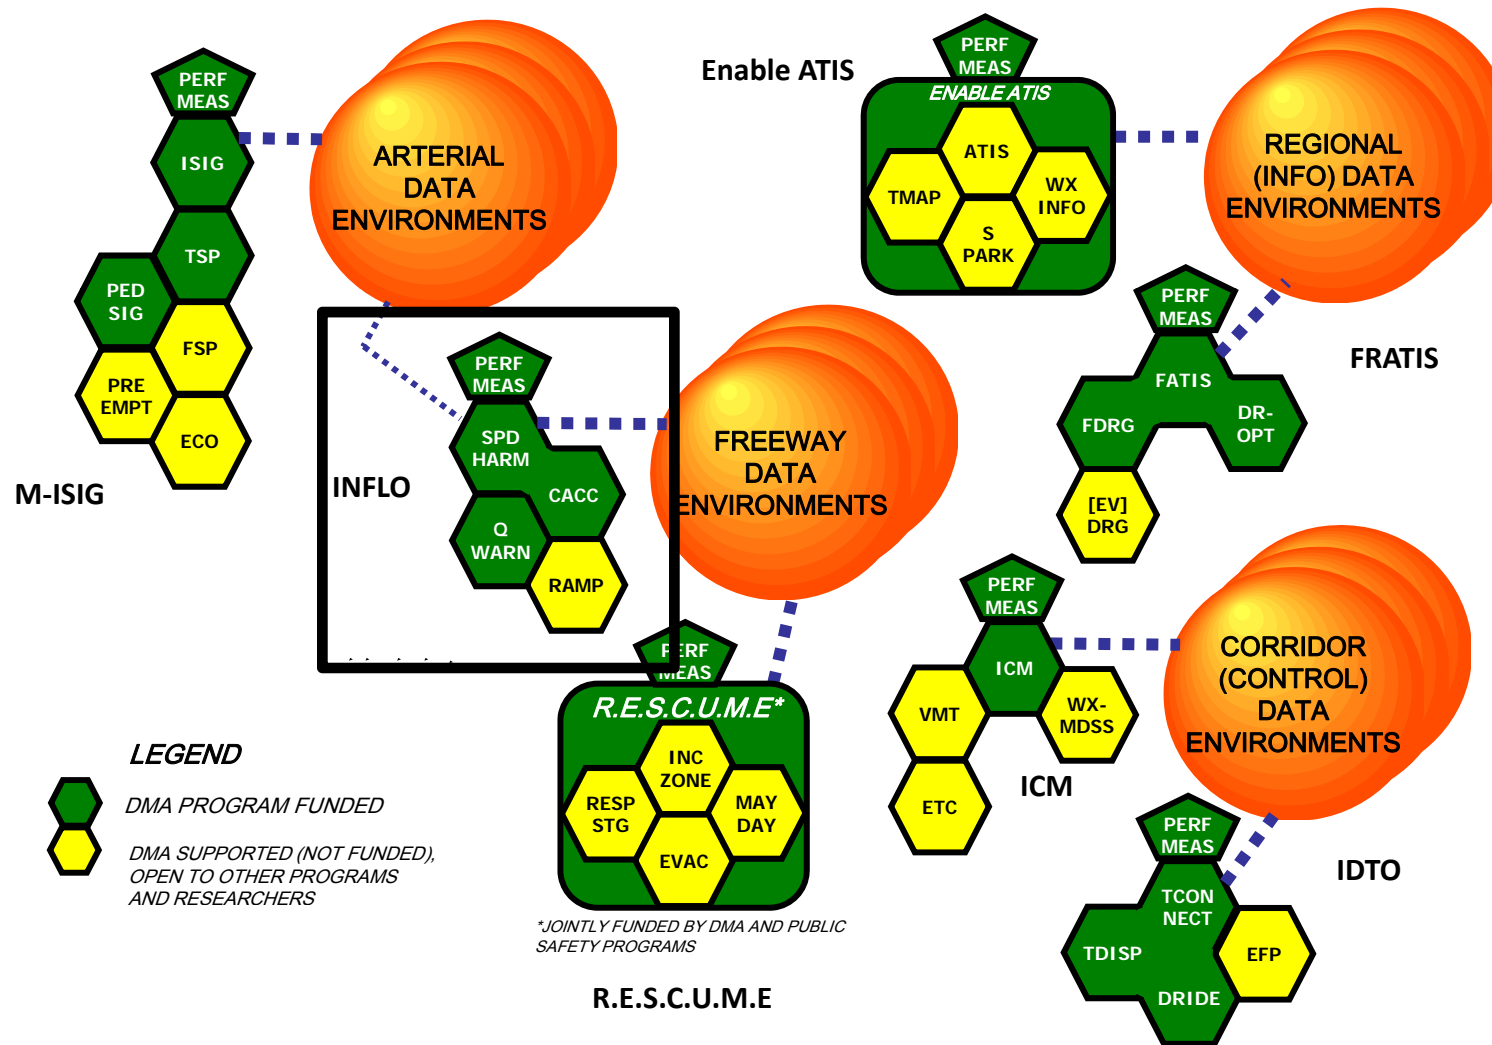

- Strong internal and external participation
  - ITS JPO, FTA, FHWA R&D, FHWA Office of Operations, FMCSA, NHTSA, FHWA Office of Safety

# DMA Program Overview

93 ideas → 30 applications → 7 bundles

# Intelligent Network Flow Optimization (INFLO)

---

- Three applications compose the INFLO bundle
  1. Queue Warning (Q-WARN);
  2. Speed Harmonization (SPD-HARM); and
  3. Cooperative Adaptive Cruise Control (CACC)
- They will enhance freeway and arterials operations by exchanging data with these respective environments and implementing applications that will improve their operations.

# SPD-HARM Concept Overview

Dynamic Speed Harmonization (SPD-HARM) aims to dynamically adjust and coordinate vehicle speeds in response to congestion, incidents, and road conditions to maximize throughput and reduce crashes.

- Reducing speed variability among vehicles improves traffic flow and minimizes or delays flow breakdown formation
- Utilize V2V and V2I communication to coordinate vehicle speeds
- Provide recommendations directly to drivers in-vehicle
- Recommend speeds by lane, by vehicle weight and size, by pavement traction

# SPD-HARM Illustrative

- 4 Upstream vehicles implement (or alert drivers to) the recommended speed

- 1 Vehicles slowing down at recurrent bottleneck broadcast speed, location, etc.

- 3 TMC relays appropriate speed recommendations to upstream vehicles

- 2 TMC identifies impending congestion and initiates speed harmonization plan for upstream vehicles

# Q-WARN Concept Overview

Queue warning (Q-WARN) aims to provide drivers timely warnings and alerts of impending queue backup.

- To reduce shockwaves and prevent collisions and other secondary crashes
- Predict location, duration and length of queue propagation
- Utilize V2V and I2V communication for rapid dissemination and sharing of vehicle information
  - E.g., position, velocity, heading, and acceleration of vehicles in the vicinity
- Allows drivers to take alternate routes or change lanes
- Applicable to freeways, arterials, and rural roads

# Q-WARN Illustrative

---

- ③ Host Vehicle receives data and provides driver with imminent queue warning

- ④ Driver provided sufficient time to brake safely, change lanes, or even modify route

- ① Queue condition forms

- ② Vehicles broadcast their rapid changes in speed, acceleration, position, etc.

# Cooperative Adaptive Cruise Control (CACC)

CACC aims to dynamically adjust and coordinate cruise control speeds among platooning vehicles to improve traffic flow stability and increase throughput.

Three possible implementations:

1. **Vehicle-to-vehicle (V2V) CACC**, where the lead vehicle communicates with the following vehicle and informs it of the location, speed, and the speed of the vehicle in front of it.
2. **Infrastructure-to-vehicle (V2I) application**, where the traffic manager sets a gap policy to maintain traffic flow at or below the roadway capacity to prevent congestion.
3. **Ad hoc Platooning concept**, where several vehicles form a platoon that behaves as a single unit.

# CACC Illustrative

## Without CACC:

- *Irregular braking and acceleration*
- *Longer headways*
- *Lower throughput*
- *Risk of rear-end collisions*

## CACC Enabled:

- *Coordinated speeds*
- *Minimized headways*
- *Higher throughput*
- *Reduced rear-end collisions*

1 Lead Vehicle broadcasts location, heading, and speed

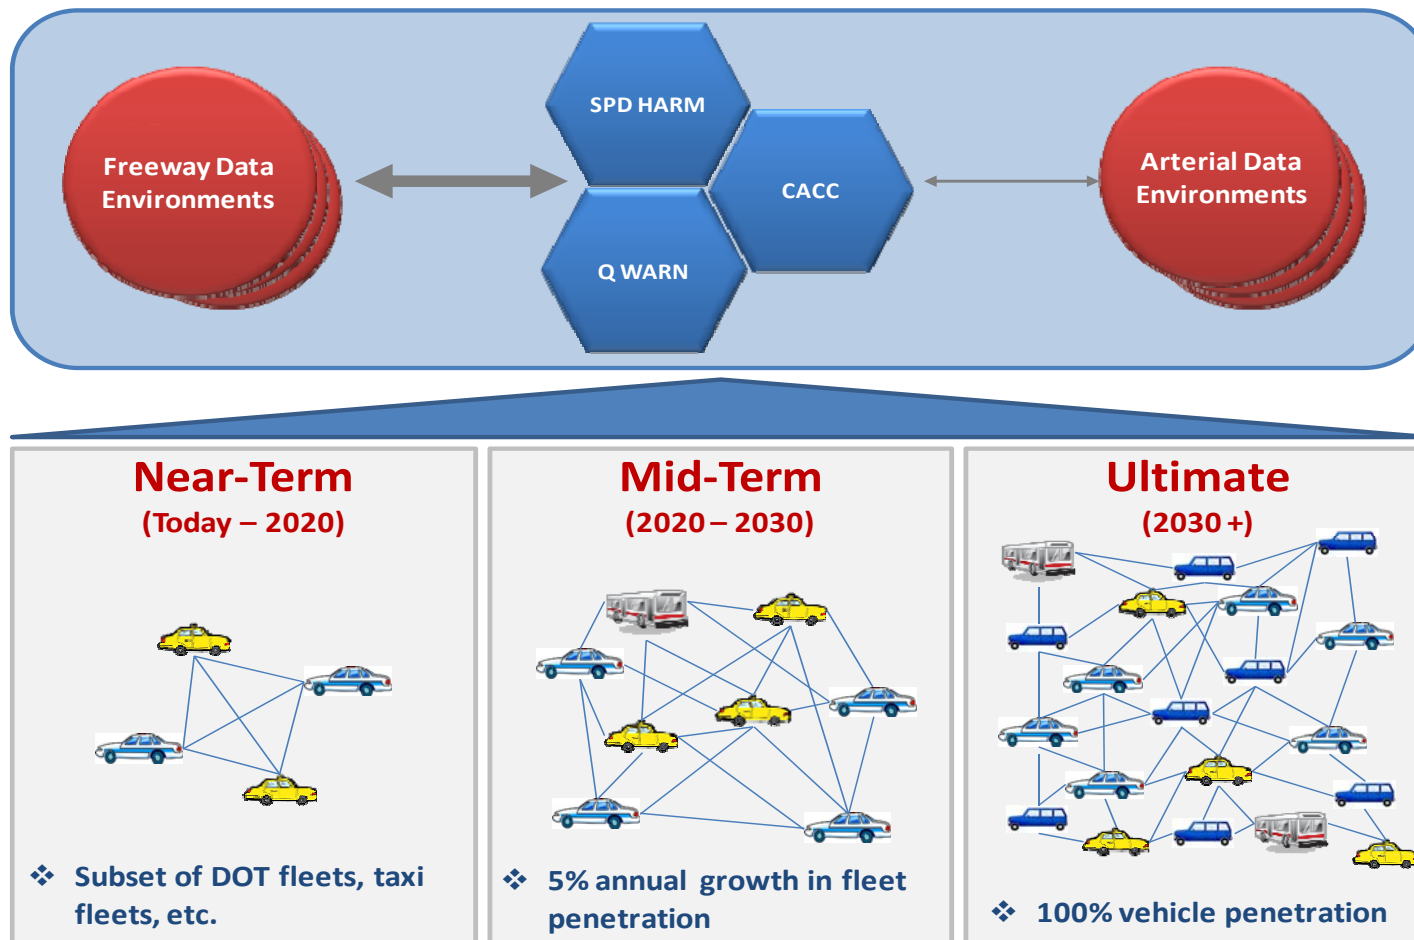

2 CACC-enabled following vehicles automatically adjust speed, acceleration, and following distance

4 TMC observes traffic flow and adjusts gap policy to manage road capacity

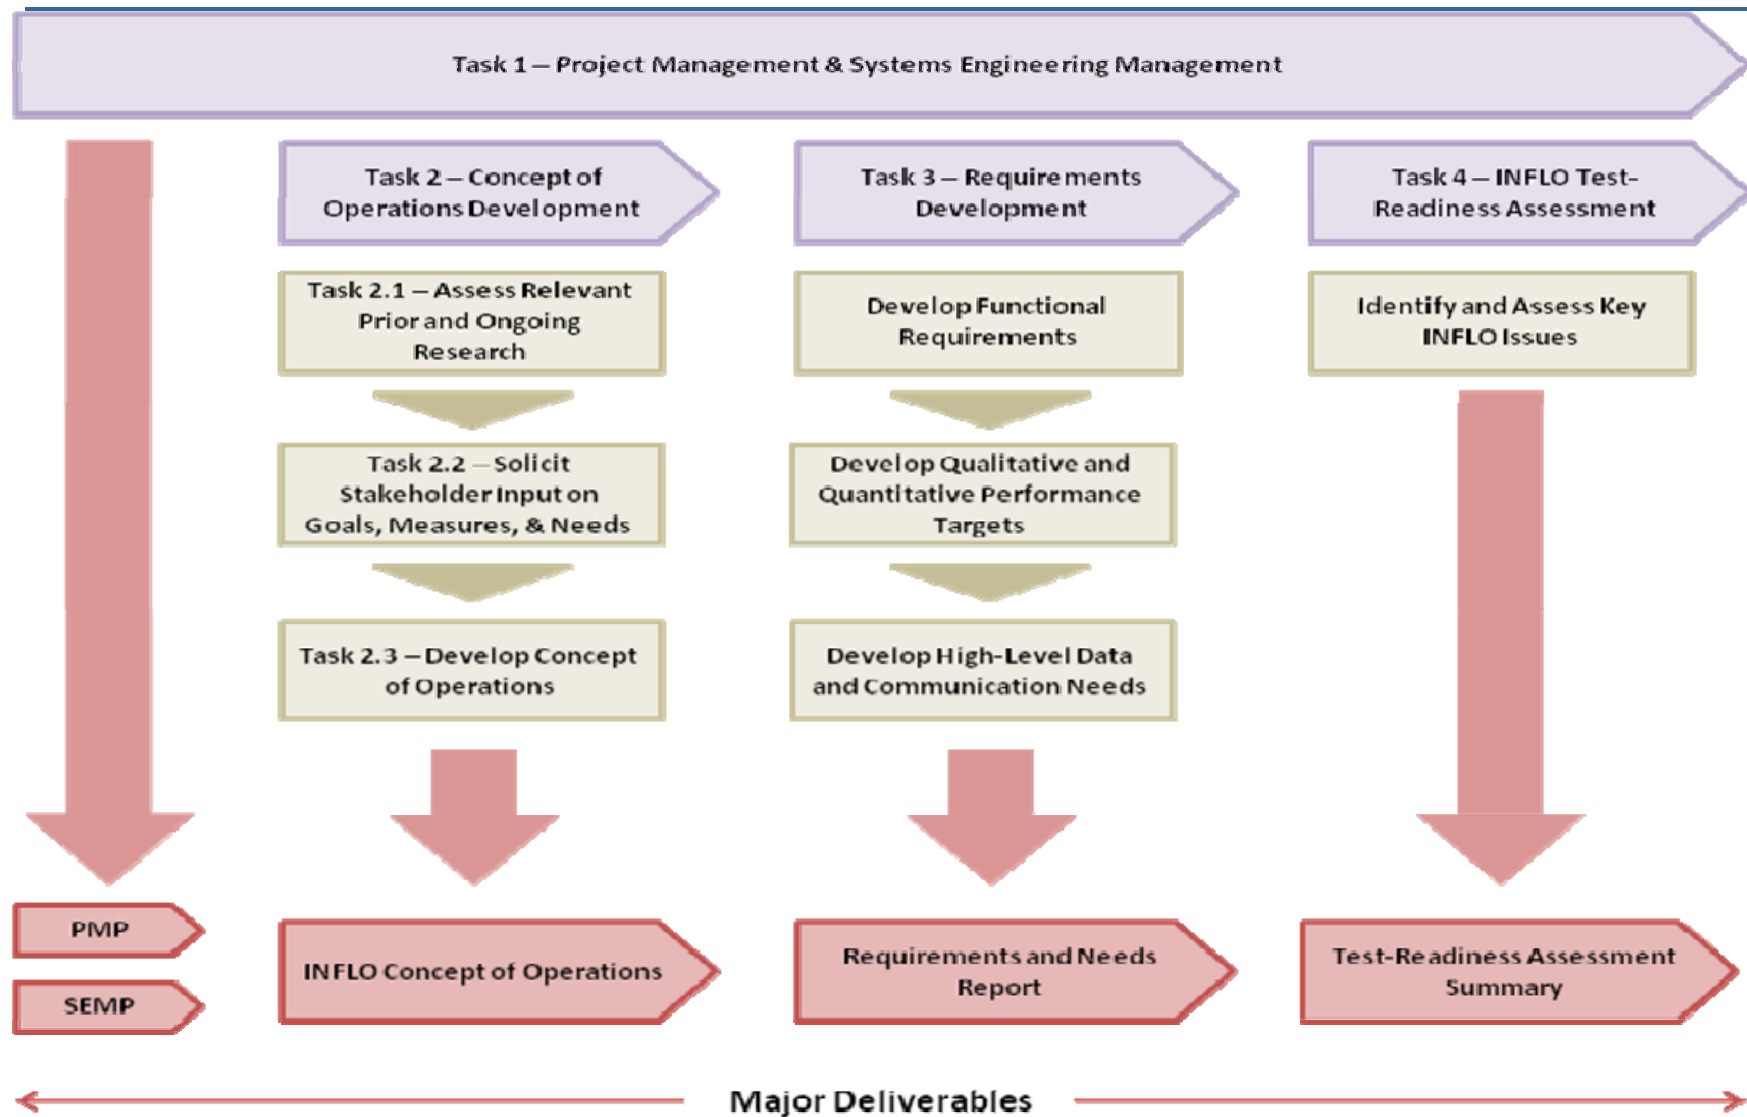

3 Any speed or acceleration perturbations by Lead Vehicle can be instantly accounted for by following vehicles utilizing V2V communication

# INFLO Deployment Vision

# Project Tasks and Stakeholder Involvement

# DMA Design/Development Status

---

- Assessment of Relevant Prior and Ongoing Research (Complete – March 212)
- INFLO Concept of Operations (Complete - June 2012)
- Functional and Performance Requirements, and High-Level Data and Communication Needs (Complete - September 2012)
- Test Readiness Assessment (October 2012)
- Next Steps – Pilot Development and Testing
